
per-family Pareto frontier (all non-dominated arms), dotted = mixture envelope — with the RIT density sweep (exploratory) —
GST labels = fh/ws percentiles; RIT labels = calibration quantile (sv = q0.90, sv_minus = q0.80, p85 = q0.85)
success rate on the development set (A′ 30 inits × 10 tasks)
analytic compute cost per decision, % of always-full inference
budget interval [41.7, 47.7] ms = [61.8, 70.6] % of full inference
always full inference: 100 % cost (67.5 ms), SR 0.847
GST (Grid-Searched Threshold, fh / ws grid) — Pareto frontier (every non-dominated arm, 17 / 32)
RIT (Risk-Indexed Threshold, s-only ladder) — Pareto frontier (every non-dominated arm, 11 / 18)
RIT on (s, v) — ablation (Risk-Indexed Threshold with the disagreement statistic) — Pareto frontier (every non-dominated arm, 8 / 12)
RIT ladder (s-only) + production gate (score_hysteresis, j=3, probe=3, L=6) — Pareto frontier (8 / 15 arms, development points)
arm on its family's frontier (non-dominated)
arm dominated within its family
two-arm mixture envelope (upper concave hull, Rev 1 rule)
